Evidence Retrieval Review Instructions

- Each annotator is asked to review ~30 examples
- Each example is a claim followed by evidence retrieved by a model, the evidence is 1000 character chunks (can overlap and be merged) from the source document
- Annotators should not discuss their examples with each other
- Each example is assigned to a total of 3 annotators
- Annotators are asked to give a label: SUPPORTS, REFUTES, NEI. Followed by an explanation of why it is applicable. Please avoid using short-forms in this for clarity and include any reasoning or assumptions you made to assign said label
- Do not look up the paper or other external sources to judge the evidence

Label Definitions

- SUPPORTS. Given only the evidence (and users' expertise) but no other parts of the paper, the evidence is sufficient to support the claim.
- NEI. Some elements of the claim are missing or are not specific enough; the conclusion is ambiguous; or there is conflicting information
- REFUTES. The evidence says the opposite of what the claim suggests. ex. sensitivity instead of resistance

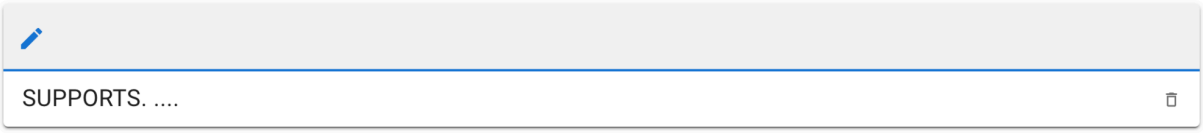

Notes on Using Doccano

Saving Input

When filling out the label and explanation field at the bottom, ensure that you hit enter each time or the input will not be saved (below is what it looks like when it is not yet saved)

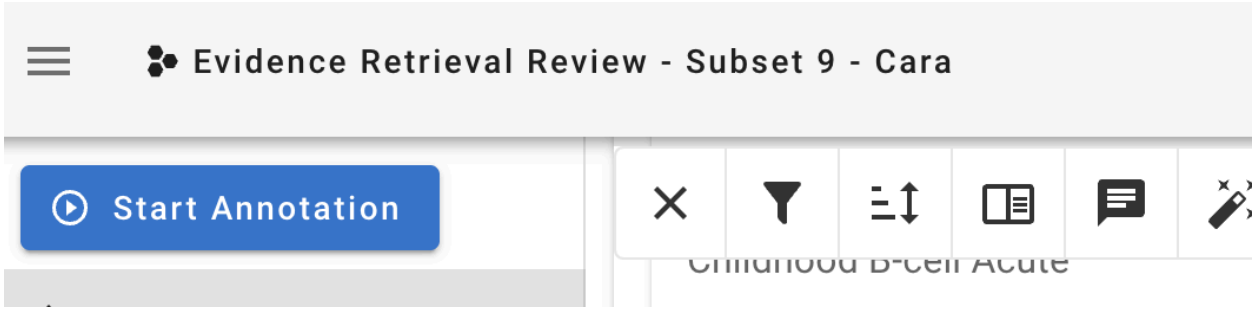

Whereas after you hit enter and ensure your input its saved it should appear like this

Marking your Progress

To ensure your count goes up as you progress through the entries. The checkbox at the top left must be changed from X to a checkmark by clicking it. This is useful if you wish to only check the ones you are sure about and leave it unchecked for ones you want to come back to later

Q&A

Do all the chunks need to support the claim? What if some of them are unrelated?

The evidence needs to be read as a whole. If any part of the evidence supports the claim and there is not conflicting information then you would label it as supports ignoring the irrelevant chunks.

Is there information from tables?

Yes, chunks can cross tables. These are formatted with tabs between columns and new lines for each row. A table chunk may or may not include the whole table and may or may not include the header which may limit its utility. If any assumptions are made by the curator they should be included in the written explanation
